Miaolin Foods B2B AI Smart Distribution Platform Planning Document

Submitted by: CRAVEVA PTE LTD

Submission recipient: Miaolin Foods

Date: December 2025

Version: v5.0 (Omnichannel Integration and AI-Powered Version)

1. Executive Summary

This plan aims to create an "omnichannel B2B brand distribution management center" for Miaolin Foods. Given that Miaolin is a large importer that needs to manage multiple international agency brands and serve different levels of B2B clients (chain stores, distributors, and individual stores), we propose a solution based on **Craveva AI Enterprise**.

This plan adopts a pragmatic "phased digitization" strategy:

- **Phase 1 (Immediate Launch):** Establish a standardized "Daily File-Based Integration" mechanism. Without altering the existing Digiwin ERP and Salesforce architecture, immediately automate orders and manage complex pricing through intelligent import/export and automatic SKU conversion technologies.
- **Phase 2 (Future Planning):** Once the platform's operational data is stable, upgrade to real-time API connectivity.

2. Key Challenges and Pain Points Analysis

Based on your business scenario and current operations, we have identified the following five core challenges:

1. **Daily maintenance of complex B2B pricing:** This requires managing multiple brands and a 5- tier pricing logic (from public pricing to customer-specific pricing). (This is a contract price). Due to fluctuations in raw material prices, it is necessary to ensure that the latest pricing strategy in the ERP system is quickly synchronized to the platform every morning to avoid price discrepancies.

2. **Order Data Format Conversion (SKU Mapping):** Customers place orders in "units," but Dingxin ERP requires them to be recorded in "cartons." If the exported order reports are not converted, subsequent manual modifications will be time-consuming and prone to errors.

y

3. **Unified Management of Multiple Brands:** As an importer, you need to manage all the brands you represent through a single back-end system, allowing customers to access comprehensive information.

One-stop purchasing, which also makes it easier for headquarters to centrally summarize orders.

4. **Too many staff: Orders come from various and disorganized sources:** Currently, orders come from multiple channels such as **websites and Line groups**, which is inefficient.

The formats vary (text messages, screenshots, voice messages). Business assistants need to spend a lot of time manually organizing and confirming specifications.

Manually keying orders is inefficient and prone to errors. 5. **Multiple**

data sources make internal integration and analysis difficult: Sales data is scattered across Dingxin ERP, Salesforce, and other systems.

The lack of a unified "data platform" to integrate these heterogeneous data in Google Workspace and Line conversations makes it difficult for management to grasp the true sales picture across brands in a timely manner.

3. Solution Architecture

This solution uses **Craveva AI Enterprise** as its core foundation and employs a modular stack to build Miaolin Foods' digital distribution hub. The architecture consists of three layers: the core operations layer, the smart pricing layer, and the AI-enabled layer.

3.1 Core Modules Configuration

To address the multi-brand management needs of importers, we selected the following enterprise-level modules as the system backbone:

- **Supply Chain & Procurement Module:**
 - **Multi-brand Inventory Center:** Supports centralized

management of multiple agency brands (such as Japanese flour, French dairy products)

It manages the product master files and inventory of oil, and supports batch number and expiration date management.

Virtual **SKU Mapper:** Responsible for mapping the "sales unit" of front-end orders.

(Unit) is automatically converted to the ERP-approved "Carton" for easy transfer. • **Financial Management Module:**

- **B2B accounting consolidation:** Processing invoices, credit notes (discount slips), and tax rate calculations, and ensuring smooth remittance.

Financial data format is compatible with Dingxin ERP

y

- **Customer & Partner Management:**

o **B2B Customer Portal:** Provides a tiered account system, allowing different levels of customers (franchise headquarters vs. franchisees) to access customer information.

The store has corresponding purchasing authority and price control.

• **Insights & Governance:**

o **Data Platform:** Aggregates heterogeneous data from ERP, Line, and Web, and provides role-based access control.

(RBAC) and the Visual War Room.

3.2 Intelligent Pricing Engine

To address the extremely complex pricing system for seedlings, the system incorporates a **5-level priority override logic to ensure...**

Accuracy of pricing and contract compliance:

- **Level 1: Base Price** - The system's underlying suggested retail price (MSRP) for a product.
- **Level 2: Public Price** - [COVER Level 1]. Displayed to unlogged visitors, typically at a higher level to ensure [security/security].
Protect the distribution system. (Do not disclose this to unlogged visitors.)
- **Level 3: Tier Pricing** - [Level 2]. Targeted at specific customer groups (e.g., Platinum Distributors).
General discounts set by retail and catering channels (e.g., 10% off the entire store).
- **Level 4: Client-Specific Pricing [Highest Priority]** - [Cover all lower layers]
o **Daily synchronization mechanism:** Supports daily import of Excel updates from ERP. Locks in absolute prices for "specific customer (Client A) + specific product (SKU 001)" to ensure consistency with offline contracts.
- **Level 5: Volume Discount** - [When the quantity reaches a threshold] Final revision Based on the above prices, if the number of purchases...
(e.g., 10 packs/1 case), an additional discount or full case price will be automatically triggered.]
- (Not required: Do we need to add the cumulative purchase quantity reached within a specific period?)
- How to convert different batch numbers into carton prices: Testing the acceptance of Dingxin's system (currently, it requires manual selection in the order).
price)
- Price of near-expiry goods: controlled by batch number, different prices for different expiry dates; the logic for near-expiry goods is set when they are received into the warehouse.

DscPage

• Evaluation>> Phase 1: Use only standard price and customer order price lines on Line>> Special promotional methods will be used in Phase 2.

• No images are needed for export and import product information; only text is required.

3.3 AI Capabilities

By introducing Craveva's proprietary AI Agent technology, the passive order-taking system is upgraded into a proactive intelligent business assistant:

1. AI Procurement Assistant

• **Application scenario:** Solve the efficiency bottleneck of order taking via Line and text messages.

• **Function:**

Natural language ordering: A customer sends a message on Line saying, "I want the same flour as last week, plus two boxes of milk."

For example, AI can automatically analyze customer intent, compare historical orders, and generate standardized shopping cart links for customers.

Household confirmation y

o **Mistake-proofing mechanism:** If the customer's instruction is ambiguous (e.g., only saying "flour" but mentioning three specifications), the AI will

automatically ask for confirmation, reducing

errors. o **It only needs to determine if there is stock available, without telling the customer the actual inventory quantity.**

2. AI Sales Agent (AI Sales Business)

- **Application scenario:** 24/7 product consulting and business development.

- **Functions:** o

Product Knowledge Base: Learn the specifications (PDF) of all brands that Miaolin represents. When customers ask "This fresh..."

"What is the cream fat content?" or "Where is it produced?", the AI can answer instantly and accurately. y

o **Related Recommendations:** Proactively recommend suitable complementary products based on the customer's browsing history.

3. AI Data Analysis (for internal management)

- **Application scenarios:** Operational insights across channels and brands.

- **Function:**

Omnichannel **data integration:** Integrating ERP shipping data, integrable channels, and order numbers from Line/Web.

According to cross-analysis y

Proactive **insights:** For example, generating weekly reports to highlight abnormal trends. For instance: "Brand A's inventory turnover rate dropped by

15% this week, promotion recommended" or "Customer B has not placed an order for two consecutive weeks (loss of potential customer)." police)".

3.4 Customized Headless Commerce Integration Architecture

To address Miaolin Foods' highly customized needs for brand image and shopping experience, this solution supports a "**Headless Commerce**"

architecture. This means that Craveva will serve as a powerful backend digital engine, seamlessly integrating with the frontend web pages developed by your designated design team through standardized APIs.

This "front-end and back-end separation" model ensures absolute design freedom while retaining Craveva's powerful B2B computing core.

Heart.

A. System division of labor boundaries

- **Frontend Layer - Designed by an external team:**

o Responsible for all UI/UX design, visual presentation, and RWD responsive web development. o

Responsible for creating a unique shopping process that aligns with Miaolin's brand aesthetics.

- **Backend Layer - Responsible for Craveva:** o **Product and Inventory Hub:** Provides

product information, specifications, and real-time inventory data.

- o **Intelligent pricing calculation:** When the front desk inquires about prices, Craveva immediately returns the data based on a "5-level logic".
The client's precise contract price ensures that the front-end does not need to rewrite complex pricing formulas.
- o **AI Business Assistant Core:** Provides API interfaces for AI dialogue and recommendation engines.

B. API Integration Process (Data Flow)

We will provide the complete **Storefront API** documentation for the design team, covering the following core interactions:

1. **Product Synchronization (Catalog API):** The front-end calls the API to retrieve the product list, images, specifications, and currently available inventory.
live y
2. **Real-time Pricing API:** When a B2B customer logs into the front-end, the front-end transmits data via API.
Send Client_ID and Product_ID, and Craveva will return the calculated Final_Price (including the Level 4 contract price). 3. **Order Writing (Order API):** After the customer checks out on the front end, the order information is written to Craveva via API, and Craveva will execute the subsequent "virtual SKU conversion" and "ERP export" processes.
4. **AI Embedding (AI Widget):** Embed the AI Sales Agent in the form of a "Chat Widget" or API.
The front desk provides 24/7 customer service. y

4. Daily Operational Workflow (SOP)

To support the "daily file exchange" model, we designed a standardized daily workflow:

1. **Morning Sync (08:30 AM):** The administrator exports the daily inventory list and customer price list from Dingxin ERP .
Once uploaded to Craveva, the system automatically updates the site's available inventory and Level 4 exclusive pricing.
2. **Trading Hours:** o **Line/Text:** AI purchasing assistant automatically processes text orders.
o **Web Portal:** Customers can log in to the website to place an order and instantly see their exclusive price.
3. **Evening Export – no later than 11:00 AM the following day: (To be confirmed)** o Administrators can download the daily order summary table with one click.

Key **action**: At this point, the system performs "virtual SKU mapping," automatically mapping the "single item" in the order.

Convert to the "Box SKU" required for ERP.

o Import the files into Dingxin ERP to complete the daily accounting.

4. (Handling of duplicate order imports)

5. Implementation Roadmap

The first phase of this project is expected to be completed and launched in **12-14 weeks** (excluding front-end design and integration).

- **Phase 1: Infrastructure Development and Data Cleaning (Weeks 1-4)**

Establish a multi-brand product database.

Key **task**: Define the import template (Excel Template) and SKU conversion rules for Dingxin ERP.

- **Phase 2: AI Training and Pricing Configuration (Weeks 5-8)**

o Train AI to recognize common phrases in Line orders (such as: add, as usual).

o Set up a 5-tier pricing logic and test the daily inflow process.

- **Phase 3: Omnichannel Process Drill (Weeks 9-11)**

- Simulates a complete closed loop of "ERP export -> Craveva order acceptance (including Line/Web) -> transcoding -> ERP import" to ensure zero data errors.

- **4: UAT and official launch (Weeks 12-14)**

The official switch has begun, with employee training and AI assistant services launched.

6. Investment Proposal

Given Miaolin's needs as a large importer, we recommend the **Craveva Enterprise Plan (Customized Enterprise Version)** :

A. Project Implementation Fee

- **Project**: One-time fee.

- **Includes**: o

Development of Dingxin ERP Format Converter (SKU Mapping Module).

- o Line order AI parsing integration module. o
- Daily pricing import automation logic configuration.
- o Custom Frontend API Support: y Provide Storefront API technical documentation. y
- Conduct technical coordination meetings with
- external design teams. y Assist with API interoperability
- testing (Sandbox environment). o Professional Onsite Service
- and data cleaning assistance.

B. System Subscription Fee

- Item: Annual or monthly recurring fee. • Includes: o Unlimited expansion benefits:
- Unlimited users, access
- to all modules.
- Modules)y
- illustrate: The subscription includes full access to the Craveva platform, including the core ERP module, CRM, and more.
- Enterprises can freely use HR, project management, and new modules that will be launched in the future, as needed.
- o Cloud hosting and maintenance: Ensure 99.9% system availability and secure data backup.
- o Future Major Upgrades: Miao Lin will enjoy these free of charge during the subscription period.
- Craveva's main system undergoes all feature updates, security patches, and performance optimizations to ensure the platform's technology never
- becomes obsolete.

C. AI Usage Fee

- Billing Model: Pay-per-Token (TPM) billing. • Note: This model is designed for high-volume AI
- computations (Line dialogue parsing, large-scale data analysis, sales knowledge queries, etc.).
- (Answer) The Token billing model is adopted, which is based on actual expenditure and payment.
- Advantages: Enterprises can precisely control AI costs, paying only for the actual value generated, and have flexible scalability.
- force.

7. Conclusion and Next Steps

This solution will free Miaolin Foods from the tedious manual order taking and quotation maintenance. Through Craveva's **intelligent transformation...**

By switching to an omnichannel AI assistant, your company will immediately gain a tool capable of handling complex B2B logic, integrating Line orders, and...

A powerful distribution platform that works seamlessly with existing ERP systems.

Recommended next steps:

7.1 Administrative & Commercial Processes

- **[v] Sign a Non-Disclosure Agreement (NDA):** We recommend prioritizing non-disclosure of information before gaining in-depth access to your ERP data and customer list.

Signing an NDA ensures the security of Miaolin Food's trade secrets.

- **[] Confirm requirements, pricing, and contract scope:** Confirm the requirements, subscription modules, and customer details in the above "Investment Plan".

Define the scope of development and complete the contract signing.

7.2 Technical Preparation

- **[] Provides a standard import template for Dingxin ERP (Excel/CSV): (To be confirmed)**

the Purpose: Provided to Craveva's technical team for developing a "virtual SKU converter".

the content: It must include a standard order import format, especially indicating which fields are required (e.g., customer).
Code, inventory number, warehouse code).

- **[v] Provide existing product master files and inventory sheet templates:**

the Purpose: Used to test the "Daily Morning Sync" process.

the content: Includes product name, SKU Code (per piece/box), batch number format, etc.

- **AI training corpus collection: []**

o **Line conversation logs:** Provides approximately 50-100 de-identified "real customer order messages" (screenshots)

(or text files) are used to train the AI purchasing assistant to recognize phrases such as "as usual" and "additional".

o **(Is it possible to use a line API to scrape historical messages?)**

o **Product Knowledge Base:** Provides product specifications, DMs, or FAQs (PDF/Word) for each brand it represents, which can
be used to train AI sales personnel to answer product questions.

7.3 Project Coordination

- **[] Arrange a tripartite technology kickoff meeting:**

the Participants: Miao Lin Project Manager + **Website Designer Zheng Zhi** + Craveva Architect

the Agenda:

1. Deliver **the Storefront API** technical documentation.

2. Confirm the data integration process between the front-end website and the Craveva back-end (login verification, price inquiry, download).
one).

3. Define the boundaries of error correction responsibility.

• [] **Defining SKU Conversion Logic Workshop (Mapping Workshop):**

the Participants: Miao Linye Assistant/Purchasing Supervisor + Craveva Data Engineer.

the content: Review each major brand to identify which products require the "single-item transfer box" rule (e.g.,

For example: A flour is 10 bags/box, B butter is 12 cans/box).
