

Biomixing Digital Transformation Proposal: Craveva Unified Cognitive ERP

Prepared for: Biomixing (Agri-tech/Biotech)

Technology Partner: Craveva

Date: 2026-02-13

1. Executive Summary

Biomixing is at the forefront of sustainable farming solutions, yet its rapid growth in specialized biotech products (like EHPurge) has introduced operational complexities—specifically in **custom recipe management, inventory traceability, and multi-stage approval workflows**.

To support this rapid scaling, we propose the **Craveva Unified Cognitive ERP**:

- 1. **Craveva ERP (hub.craveva.com)**: A robust, modular operational backbone tailored for manufacturing and distribution.
- 2. **Craveva AI (ai.craveva.com)**: A native "AI Brain" that lives within the ecosystem, providing real-time intelligence to Executives, R&D, and Factory Directors.

The Result: A seamless architecture where the President can review recipes, the Factory Director can check stock, and the VP can simulate margins—all in one unified platform.

Important note (alignment): This proposal assumes Biomixing will standardize operations on **Craveva ERP as the primary ERP**, with AI agents as productivity multipliers. This document avoids references to other ERP brands.

2. The Solution: Unified Cognitive ERP

We propose a single ecosystem where operations and intelligence are inseparable.

2.1 The Operational Backbone (Craveva ERP)

Craveva ERP handles the core lifecycle:

Module	Function for Biomixing
Leads & Estimates	Manages the "Custom Recipe" request flow from distributors (e.g., Siam Shrimp).
Project Management	Replaces manual "Project Request Forms". Tracks the Factory Director's tasks (Labeling, Mixing) and Business Assistant's checks.
Inventory & Purchase	Manages critical biotech raw materials (Probiotics, Feed Additives) with batch tracking.
Finance & Invoicing	Automates the "Settlement" phase, linking delivery notes directly to invoices.

2.2 The Intelligence Layer (Craveva AI)

Because the AI lives where the data lives, there is **zero latency**.

Agent Role	Capability	Biomixing Use Case
Sales AI Agent	Historical Intelligence	<i>President's Review:</i> Instantly retrieves past successful formulations for a specific client to aid approval decisions.
Analytic AI Agent	Predictive Simulation	<i>VP's Pricing:</i> Simulates "What if raw material costs rise by 5%?" to set safe margins.
Analytic AI Agent	Operational Query	<i>Factory Director:</i> Checks real-time stock across warehouses using natural language ("Do we have enough Base A?").

2.3 Omni-Channel Sales Agent (LINE & WhatsApp)

As a multinational organisation, Biomixing's sales teams and distributors operate across multiple countries and messaging habits. To support this with **low integration risk and fast time-to-value**, Craveva will provide an **omni-channel Sales Agent** that is rolled out in **phases** and built on a **single, reusable webhook pattern** (the same pattern already used by the Recruit AI module).

- **Step 1: Single-Channel Pilot (WhatsApp First)**
 - Start with **one primary channel (WhatsApp)** in a single pilot market.
 - Use a standard WhatsApp Business API provider to handle messaging infrastructure, while Craveva focuses only on the webhook and business logic.
 - The same **Sales AI Agent** that supports the President and VP in the ERP will power these WhatsApp conversations.
 - Scope is intentionally limited to a few flows: recent orders, basic product recommendations, and quote triggers.
- **Step 2: Reuse the Same Pattern for LINE**
 - Once the team is comfortable with WhatsApp flows and testing, **LINE** is added using the **same webhook design**: incoming message → Craveva endpoint → AI + ERP lookup → reply.

- For markets like Thailand, Japan, and Taiwan, where LINE is dominant, Biomixing's sales agents will then be able to:
 - Search client history ("Show last 3 orders for this farm") directly from LINE.
 - Trigger quote/estimate creation in the ERP from chat.
 - Receive AI-suggested responses for technical questions (storage conditions, dosage, compatible products).
 - All conversations are logged back into Craveva as timeline events against the client record.
 - **Single Brain, Simple Flow**
 - Both channels call into **one unified Sales AI endpoint** that reads from live ERP data (clients, prices, stock, delivery status).
 - This avoids building two separate bots and keeps the integration lean and maintainable.
 - Initial UAT is performed with a focused set of internal pilot users and conversation scenarios before expanding.
 - **Benefits for Biomixing as an MNC**
 - **One brain, many channels:** Consistent answers and pricing policy whether the sales agent is on desktop ERP, WhatsApp, or (later) LINE.
 - **Controlled rollout:** Phased implementation that reduces operational risk and allows learning before wider deployment.
 - **Country flexibility:** Local teams can keep using their preferred messaging apps without creating data silos.
-

3. Addressing Biomixing's Specific Workflow

We have analyzed your current process flow (Order → Recipe Review → Production → Delivery) and designed Craveva to eliminate bottlenecks at each step:

3.0 Process Flow (One Image Per Phase)

To make the process flow easier to read, the diagram is presented as **one phase per image**:

Phase 1: Order Intake & Recipe Review

Phase 1
Order Intake & Recipe Review

Phase 2: Planning & Pre-Production

Phase 3: Production & QA

Phase 4: Fulfillment & Settlement

Phase 4 Fulfillment & Settlement

3.1 LINE Order Workflow (As-Is)

Your current order intake and production handover relies heavily on **LINE messages**, supported by manual consolidation by a business assistant and handover to the factory team.

3.2 Recommended AI Agents for LINE → ERP → Production

To support your existing workflow while migrating to Craveva ERP, we recommend a phased set of agents. These agents are designed as **assistants with human confirmation** (low risk, high ROI).

Recommended count

- **Phase 1 (Core): 3 agents** to stabilize order intake and handover.
- **Phase 2 (Expansion): +3 agents** to reduce exceptions and improve speed/compliance.
- **Total potential: 6 agents** (expandable later as needed).

Agent	Primary Trigger	Core Tasks	Output to Craveva ERP
Order Intake Agent	New LINE message / call summary	Extract customer/SKU/qty/delivery date/urgent flag; detect missing fields; propose a structured order draft	Creates Order Intake Draft with confidence score and missing-field checklist
Order Validation & Follow-up Agent	Draft created with missing fields	Generates follow-up questions (one-by-one) to complete required fields; prevents incomplete orders from moving forward	Moves draft to Confirmed Order once required fields are complete

Production Handover Agent	Confirmed order	Generates a standardized Production Handover Brief (Scenario A quick notify vs Scenario B full notice); assigns owner; sets internal due dates	Creates Production Task Pack + handover PDF/printable sheet
Inventory & Shortage Agent	Confirmed order / handover created	Checks on-hand inventory and batch/expiry constraints; flags shortages; proposes purchase request items	Creates Shortage Report + Purchase Request Draft
Production Planning Agent	Handover accepted by factory manager	Suggests a production schedule slot based on due date and capacity assumptions; highlights collision risks	Creates Proposed Production Schedule and exception alerts
Compliance & Delivery Agent	Delivery preparation	Ensures labeling/mixing/QA steps are complete before delivery; generates delivery checklist; prepares customer-facing status update	Creates Compliance Checklist + Delivery Readiness status

Agent workflow (end-to-end)

1. Customer sends order details in LINE (text/voice/screenshot) or by phone call.
2. **Order Intake Agent** converts the message into a structured draft (customer, SKU, quantity, delivery date, urgency).
3. **Order Validation & Follow-up Agent** prompts the business assistant (or sales) for missing fields and final confirmation.
4. Once confirmed, Craveva ERP records the order and triggers:
 - **Production Handover Agent** to generate a consistent handover brief (replacing ad-hoc LINE notes / paper notices).
 - **Inventory & Shortage Agent** to pre-check materials and suggest purchase actions early.
5. Factory manager accepts the handover in Craveva:

- **Production Planning Agent** proposes schedule and highlights risks (optional early rollout).

6. Before shipment:

- **Compliance & Delivery Agent** enforces required QA tasks and creates a delivery readiness checkpoint.

Positioning note (for client conversations): Agents are presented as **potential productivity upgrades** that can be activated progressively after the Craveva ERP foundation is live.

Phase 1: Order & Recipe Review (The "3-Day Wait")

- **Current Process:** Sales submits a request → President reviews formula history → VP checks pricing. This manual loop often takes 3-4 days.
- **Craveva Solution:**
- **Sales AI Agent:** As the Sales Rep types the Estimate, the AI instantly displays: *"Last 3 similar recipes for Siam Shrimp were approved with 15% margin."*
- **Result:** The President has all data *immediately*, potentially reducing approval time from days to hours.

Phase 2: Production Planning (The "Manual Gap")

- **Current Process:** Factory Director manually checks stock to decide: *"Do we have enough?"* If yes (3-4 days), if no (5-7 days). This relies on paper "Project Request Forms".
- **Craveva Solution:**
- **Analytic AI Agent:** Automatically scans the Bill of Materials (BOM) against live inventory.
- **Result:** The system flags "Low Stock" *before* the order is even signed, triggering an automatic Purchase Request for the missing biotech ingredients.

Phase 3: Production & Fulfillment (Compliance)

- **Current Process:** Manual checks for "Labeling", "Mixing", and "Quality Certs" before shipping. Risk of human error or temperature deviations.
 - **Craveva Solution:**
 - **Projects Module:** The system *locks* the "Create Delivery Note" button until the "Quality Check" task is complete.
 - **Logistics AI Agent:** Automatically verifies storage conditions (e.g., "Keep < 25°C") and suggests the best Cold Chain carrier.
 - **Result:** 100% compliance. No product leaves the factory without a digital quality stamp and safe routing.
-

4. Implementation Roadmap (Fast-Track)

Craveva's modular architecture allows for a phased, high-impact rollout.

Phase 1: Operations Foundation (Weeks 1-4)

- **Goal:** Digitize the "Order to Cash" flow.
- **Actions:**
 - Setup Craveva ERP (Sales, Inventory, Projects).
 - Import Product Master (EHPurge, Probiotics).
 - Configure the "President Approval" workflow in Estimates.

Phase 2: Intelligence Activation (Weeks 5-8)

- **Goal:** Turn data into decisions.
 - **Actions:**
 - Activate **Sales AI Agent**: Train on historical recipe PDFs and client emails.
 - Activate **Analytic AI Agent**: Connect to Inventory for real-time stock queries.
 - Launch a **WhatsApp Sales Agent pilot** in one market using the existing webhook pattern, with a small set of supported flows (recent orders, basic recommendations, quote triggers).
 - **Training:** Show the Factory Director and pilot sales team how to "talk" to the ERP and AI.
-

5. Strategic Advantage

By choosing **Craveva (ERP + AI)**, Biomixing gains:

1. **Unified Ecosystem:** A single platform for both operations (Order/Delivery) and intelligence (Forecasting/Approvals).
2. **Agility:** Custom workflows (like your Recipe Review) are native configurations.
3. **Future-Proofing:** As your biotech product lines grow, the AI learns and adapts to new formulations automatically.

Conclusion: This proposal aligns perfectly with your goal of "Pioneering Sustainable Farming Solutions" by giving you a sustainable, scalable digital infrastructure.
